Abstract:
Because of their complexity and the nature of their inherent risks, variable annuities need specific consideration for reserving and regulation purposes. In the first part of the study, we identify, for various type of variable annuities, the specific issues to be dealt with, including nature of the risks, hedging (static/dynamic), policyholder behaviour. We explore some key considerations on reserving with risk neutral stochastic simulations.
In a second step, we illustrate issues relating to asset admissibility and solvency requirements.
